EMI/RFI CABLE PREPARATION FOR INSTALLATION OF AN ADAPTER

1. Prepare the cable making sure that a sufficient length of shield is available, so that it fits against the front shoulder of the lip groove.
2. Before insertion of connector contacts, slide the heat-shrinkable connector boot onto the cable followed by the Adaptor.
3. Position the heat shrinkable boot, Adaptor, and shield braid out of the way and insert the connector contacts. Depending upon the shielding braid size it can either be folded back onto itself or bunched up concertina style out of the way for easy access to the cable conductors.
4. Screw the Adaptor onto the connector and tighten to the torque value specified by the connector manufacturer. It is recommended that the connector threads are lubricated with a suitable compound if a liquid thread lock is not used. The adaptor should be hand tightened to ensure proper thread alignment and then tightened with a strap wrench and torque meter to the specified torque.
5. Bring the cable shield braid up onto the adaptor body so that it fits against the front shoulder of the lip groove Alternatively extend the braid past the lip groove.
6. Open up the constant force spring and wrap it around the cable braid section that is positioned over the constant force spring slot area of the adaptor. This is most easily accomplished by lifting up the end of the spring and trapping the braid covered adaptor between the spring coil and raised end. The spring will now stay in place and can be installed by simply rolling the spring coil around the braid covered adaptor. Refer to appropriate code of practice for procedure to install heat shrink shape.

INTRODUCTION TO ZETALOK™

Zetalok™ is a unique re-enterable termination system for connecting a cable shielding braid to a circular connector. When used in conjunction with our heatshrink moulded shape, a sealed environmental termination system is achieved.

Zetalok™ incorporates a specially developed backshell designed to accommodate the braid using a constant force spring. The main feature is that the termination can be re-entered when required. It is thereby possible to effect repairs to connector pins and sockets without the need to discard any part of the shielding system.

This method gives comparable performance to the other braid trap arrangements, in terms of tensile strength and DC resistance. Furthermore, due to the self-tensioning nature of the spring, it is exceedingly resistant to vibration and shock.

FEATURES

- Purpose developed backshell incorporating a self tensioning spring
- Tensile force to pull off braid exceeds 150 lbs. When used in combination with a heat shrink boot, tensile force required to remove is in excess of 250 lbs
- Operator friendly and easy to install
- Constant force spring produces a DC contact resistance at 20° Celsius of less than 1 milliohm due to 360° contact with the backshell
- Constant force spring electrical and mechanical characteristics are unaffected by vibration, shock and temperatures between -65° and 150° Celsius
- Comprehensive Independent witnessed test report available on request, covering Thermal Cycling to MIL-STD-202E Method 107G. Vibration Testing to MIL-STD-176-1. Shock Testing to MIL-STD-1344A Condition G.
- Constant force spring can be used in corrosive environments
- Constant force spring can be used with single or double braids when used in combination with backshells designed for use with the Zetalok™ spring

BENEFITS

- Spring can be re-opened with no special tools and subsequently re-used
- Possible to effect repairs to connector pins and sockets without the need to scrap any part of the shielding system
- Product achieves a 360° screen termination
- Four sizes of springs cover a range of entry sizes
- Spring has a pre-set compressive force and needs no external calibration
- Constant force spring can be used in conjunction with backshells and braid tails, without the use of swaging equipment, in the factory or in the field

Zetalok™ is a unique re-enterable termination system for connecting a cable shielding braid to a circular connector. When used in conjunction with our Heatshrink moulded shape, a sealed environmental termination system is achieved. The main feature is that the termination can be re-entered when required. It is there by possible to effect repairs to connector pins/sockets without the need to discard any part of the shielding system. Due to the self-tensioning nature of the spring, it provides excellent resistance to vibration and shock.

HellermannTyton Zetalok™ Springs are tested to MIL-STD-202G and MIL-STD-167-1 (Ships).
